UBI FundWatch: AI Driven Fund Flow Intelligence System

- ## The Problem

Every day, banks process **millions of transactions**, but they lack visibility into how money actually moves across accounts. Fraudsters exploit this gap by using complex techniques like **layering (multiple transfers), round-tripping (circular flows), and structuring (splitting large amounts)** to hide illegal activity.

Despite advanced systems, **over 80% of fraud detection is still reactive**, meaning banks identify issues only after significant damage has occurred. Manual investigation of transaction trails can take **hours to days**, allowing suspicious funds to move rapidly across multiple accounts within minutes.

- ## Our Solution: UBI FundWatch specially designed for Union Bank of India

UBI FundWatch transforms raw transaction data into an **intelligent, real-time fund flow network**, enabling banks to **track every rupee instantly**. By combining **Graph Analytics + AI**, the system detects suspicious patterns such as rapid multi-hop transfers, circular transactions, and unusual behavior deviations all in real time.

- **Detect fraud in seconds instead of hours**
- **Trace complete fund journey across 5-10+ accounts instantly**
- **Generate real time alerts with 92%+ accuracy**
- **Explain fraud cases in simple language using AI in Hindi & English both.**

This enables bank officials to **take immediate action, such as freezing accounts before funds disappear**, shifting fraud management from reactive detection to **proactive prevention**.
